

Night Shift Reports

Part 2 — Apply the Routing

Take the file back from the office with the dropdowns filled in, and move every row to the sheet and destination it was tagged for.

Prepared for B&R Food Services Inc.

Field	Detail
Input	The Part 1 workbook, with the Sheet dropdown, Update vendor column, and Driver Setup sequence filled in.
Output	The four working sheets with every row moved to its tagged destination; the three source sheets dropped.
Starts when	The office hands the file back with routing decisions made.
Next	Part 3 — Report Build-out.

1. The Three Office Inputs

The office fills in three things. Part 2 acts on all three.

- **The Sheet dropdown (column A)** on All Orders, Jetro source and PO — which of the three sheets the row belongs on.
- **The Update vendor column (column C)** on Warehouse short — where each shorted row is sourced.
- **The Driver Setup pull sequence** — the drivers listed in the order they leave the warehouse. The first driver leaves first; the last leaves last.

Routing is decided per row. If the same code appears on several rows tagged differently, each row goes to its own destination.

2. Apply the Sheet Dropdown

For All Orders, Jetro source and PO:

- Move each row to the sheet named in its Sheet dropdown (column A).
- After the move, reset the row's Sheet tag to match its new home sheet.
- Rows tagged with their own sheet stay where they are.

3. Apply the Warehouse short Routing

Route each Warehouse short row by its Update vendor tag (column C):

Office picks	What happens to that row
Jetro	Added to Jetro source; removed from Warehouse short.
A vendor name	Moved to PO; removed from Warehouse short.
WH	Moved to PO with the vendor set to WH; removed from Warehouse short.
A bin (COOLER, COOLER-PD, DRY, FREEZER, PICK UP)	Sent back to All Orders. The Bin column is overwritten with the chosen bin; removed from Warehouse short.

Shortage value re-homing: when a row carrying the shortage value is moved out, the value re-homes onto the first remaining row of the same code.

4. Recalculate PO Total Qty

After all moves are done, recalculate the PO Total Qty column — the sum of ordered Qty per item code, on the first row of each code — so the totals reflect the rows that landed on PO.

5. Confirm the Driver Pull Sequence

The office has filled in the Driver Setup sheet — the drivers in pull order. Part 2 leaves this sequence in place; it is the master driver order that Part 3 builds every report from. The Freezer groups derive from it automatically (first 3 drivers = Freezer one, the rest = Freezer two).

6. Drop the Source Sheets

The three source sheets — Inventory, item list, Shopping History — were used only to compile the All Orders sheet in Part 1. Once the office has made its decisions, their purpose is complete. Remove them from the workbook; the office does not send them back.

7. Step-by-Step — Part 2

1. Take the file back from the office with all three inputs filled in.
2. Apply the Sheet dropdown — move each row to its tagged sheet; reset the Sheet tag.
3. Apply the Warehouse short routing — Jetro to Jetro source; vendor or WH to PO; a bin back to All Orders.
4. Re-home any shortage value carried by a row that moved out of Warehouse short.
5. Recalculate PO Total Qty.
6. Confirm the Driver Setup pull sequence is filled in — it carries through to Part 3.
7. Drop the Inventory, item list and Shopping History sheets.
8. The routed working sheets are ready. — End of Part 2. Continue with Part 3.

8. Key Rules — Quick Reference

Rule	Detail
Office inputs	Three: the Sheet dropdown, the Update vendor column, and the Driver Setup pull sequence.
Routing basis	Per row. Each row goes to its own destination.
Sheet dropdown	Column A; moves the row to All orders / Jetro source / PO. Tag reset after the move.
Jetro routing	From Warehouse short, Jetro sends the row to Jetro source.
Vendor routing	From Warehouse short, a vendor name sends the row to PO.
WH routing	From Warehouse short, WH sends the row to PO under the vendor WH.
Bin routing	From Warehouse short, a bin tag sends the row back to All Orders; Bin column set to the tag.
Shortage re-home	Value moves to the first remaining row of the code when the carrier row leaves.
PO Total Qty	Recalculated after routing — sum per code, on the first row of the code.
Driver sequence	Filled by the office on the Driver Setup sheet; carries through to Part 3 unchanged.
Source sheets	Inventory, item list, Shopping History are dropped — their purpose ended in Part 1.
