

Night Shift Reports

Part 4 — The Jetro Branch

How the Jetro source sheet becomes the four Jetro deliverables: the Jetro page, the Jetro Report PDF, the Menu page, and the Jetro produce sheet.

Document	Part 4 of the Night Shift Reports A-to-Z workflow
Builds from	The Jetro source sheet (output of Stage 2 extraction)
Produces	Jetro page · Jetro Report PDF · Menu page · Jetro produce
Status	Built and locked. Driver order and column mapping verified against the workbook itself.

0. Where Part 4 Sits

Stage 2 of the workflow splits the compiled orders three ways. Every row whose Bin is numeric is moved into a separate Jetro source sheet. Part 4 takes that sheet and turns it into the picking and pricing paperwork the Jetro side of the operation needs. It is a self-contained branch — once Jetro source exists, nothing else in the workbook feeds into it.

Part 4 produces four things, in this order:

1. **Jetro source — sorted.** The source sheet is ordered so every later output inherits the same sequence.
2. **Jetro page.** One block per customer order, the warehouse picking layout.
3. **Jetro Report PDF.** The Jetro page rendered as the printable landscape pull sheet.
4. **Menu page.** An index mapping each PDF page to the customer orders on it.
5. **Jetro produce.** The produce-only rows on their own sheet for the produce department.

1. The Input — Jetro source

Jetro source carries the full 35-column order layout. Part 4 reads the columns below. The column letters are the ones in this workbook — they are listed explicitly because they differ from the letters used in earlier parts of the master guide.

Column	Header	Used for
C	Qty	Ordered quantity for the line
D	Product Name	First part of the merged product description
E	Code	Item code — appended to the merged product text
F	Bin	The numeric Jetro bin
G	Description	Second part of the merged product description
M	Price	Sell price — used on Jetro produce
O	Name	Customer name — drives grouping and sort
R	Transaction Date	Delivery date shown in each block header
S	Driver	Driver name — drives the pull sequence
W	CATEGORY NAME	Identifies Produce rows

Column	Header	Used for
X	CURRENT COST PRICE	Cost price — used on Jetro produce
Z	Product	Third part of the merged product description
AA	New bin	Alternate bin — shown only when it differs from Bin
AB	unit price	JTR U COST — used on Jetro produce
AC	case price	JTR C cost — used on Jetro produce
AD	Quantity On Hand	The QTY column on every output

Note on column letters. The master A-to-Z guide was written against an earlier layout (Bin = C, Product Name = A, and so on). This workbook is different. Part 4 was built by matching the header meaning, not the letter — so it stays correct even though the letters moved.

2. The Driver Pull Sequence

Every Jetro output is ordered by driver priority first. The sequence is taken from the workbook's own `_drivers` helper sheet, which is the single source of truth:

1	2	3	4	5	6	7	8
Glen	Abraham	Ramon	Gilberto	Jose	Adrian	Luis	Z

Any driver name not in this list sorts after Z, in alphabetical order. This same sequence is used by the Dry branch and WH Pickup, so keeping it consistent matters.

3. Step One — Sort Jetro source

Before any output is built, Jetro source is sorted on three keys, in this priority:

Priority	Sort key	Direction
1	Driver — by the pull sequence in Section 2	Glen first ... unlisted drivers last
2	Customer name (column O)	A → Z within each driver
3	Bin (column F)	Ascending within each customer

Every later output — the Jetro page, the PDF, and the Menu page — inherits this order, so the sort is done once, here.

4. Step Two — The Jetro Page

The Jetro page is the warehouse picking layout: one block per customer order, blocks in driver-then-customer order. Each block opens with a header row spanning all five columns — Customer name | Delivery date | Driver — followed by a column-header row, then the order's lines.

Col	Header	Source / Rule
A	Bin	Column F.
B	New bin	Column AA. Left blank when it equals the Bin in column A.
C	Qty	Column C (ordered quantity). Centered.
D	Product	Merge of Product Name (D) + Description (G) + Product (Z) + Code (E), joined on a single line, separated by a forward slash with no spaces — Product Name/Description/Product/Code.
E	QTY	Column AD (Quantity On Hand). Centered.

Product cell format. The four pieces sit on one line, slash-separated with no spaces around the slash — for example Beef Patty/4oz frozen/Case of 40/BF1234. (This replaces the earlier stacked one-piece-per-line layout.)

Produce rows

Any row whose CATEGORY NAME (column W) is Produce is shaded light grey on the Jetro page. Those same rows also appear on the Jetro produce sheet — see Section 7. The two departments work from the two views.

5. Step Three — The Jetro Report PDF

The Jetro page is rendered as a printable landscape PDF for the pickers. The format rules:

- Landscape orientation; a page number printed on every page.
- White column headers, black text, black borders throughout.
- Product text wraps onto a second line where needed and is never clipped.
- Each customer order is kept whole on one page. It only splits across pages when it cannot fit even at the smallest font.
- When an order does span pages, every carry-over page repeats the column header and a “(continued)” band naming the customer, so a picker always knows whose order a page belongs to.
- Several small orders share a page rather than wasting space. No blank pages.
- Adaptive font: larger on light pages, smaller only for a very large order.

On the current run, the report came to 23 pages — most orders sat one-to-a-page or shared, while the largest order (43 line items) spanned four pages with continuation headers.

6. Step Four — The Menu Page

The Menu page is the index to the printed report. It is built after the PDF, because it depends on where each order actually landed once pagination ran.

Col	Header	Content
A	Page number	The PDF page. A multi-page order shows a range, e.g. 3-6.
B	Customer Orders	Every customer order header on that PDF page, stacked in one cell.
C	Pulled by	Left blank — the warehouse writes in who pulled it.

Important: the page numbers are read back from the finished PDF, not estimated from row counts. A row-count estimate drifts as soon as product text wraps; reading the rendered document is the only reliable way to get the ranges right.

7. Step Five — The Jetro Produce Sheet

A separate sheet holding only the Produce-category rows (CATEGORY NAME = Produce). It is sorted by Bin, then by product name. Where the same product name repeats, its Qty is summed into the Total qty cell of the first occurrence; later occurrences leave Total qty blank.

Col	Header	Source / Rule
A	Bin	Column F.
B	New bin	Column AA. Blank when it equals Bin.
C	Qty	Column C (ordered quantity).
D	Total qty	Sum of Qty for a repeated product name, on its first row.
E	Product Info	Merge of Product Name (D) + Product (Z) + Code (E), joined on a single line, separated by a forward slash with no spaces — Product Name/Product/Code.
F	Sell price	Column M.
G	Cost price	Column X (CURRENT COST PRICE).
H	JTR U COST	Column AB (unit price).
I	JTR C cost	Column AC (case price).
J	Customer name	Column O (Name).
K	Driver name	Column S (Driver).

The four price columns — Sell price, Cost price, JTR U COST, JTR C cost — use the 0.#### number format: full precision, up to four decimals, never rounded or padded. This matches the precision rule from Stage 1 of the master workflow.

8. Part 4 — Quick Reference

Rule	Detail
Input	Jetro source — the numeric-bin rows extracted in Stage 2.
Driver order	Glen, Abraham, Ramon, Gilberto, Jose, Adrian, Luis, Z; unlisted drivers last. From the _drivers sheet.
Sort	Driver priority → Customer name (O) → Bin (F). Done once, on Jetro source.
Jetro page	One block per order. Spanned Customer Date Driver header, then 5 columns: Bin, New bin, Qty, Product, QTY.
Product merge	Product Name + Description + Product + Code on one line, slash-separated, no spaces: Product Name/Description/Product/Code.
New bin	Shown only when it differs from Bin; blank when equal.
Produce	CATEGORY NAME = Produce. Grey-shaded on the Jetro page; also listed on Jetro produce.
Jetro Report PDF	Landscape, page numbers, black borders, wrapped text, adaptive font. Orders kept whole; carry-over pages get a "(continued)" band. No blank pages.
Menu page	Built from the finished PDF. Page number (range if multi-page), stacked customer headers, blank Pulled by.
Jetro produce	11 columns; produce rows only; sorted Bin then product name; repeated product names summed into Total qty; Product Info slash-separated, no spaces; price columns 0.####.

This completes Part 4. The Jetro branch is built and locked; the source sheets are not part of the final deliverables.
